Drizzle Dreams and Lovestruck Things: Exploring the Poetics of Atmosphere and Emotion

The "lovestruck things" part of the phrase delves into the biological and psychological aspects of romantic love. This isn't simply a feeling; it's a complex interplay of hormones, neurotransmitters, and cognitive processes. Research has shown that romantic love activates specific brain regions associated with reward, motivation, and attachment. Dopamine, a neurotransmitter associated with pleasure and reward, plays a crucial role in the initial stages of romantic love, contributing to the intense feelings of excitement and euphoria. Over time, the brain's response shifts, with oxytocin and vasopressin playing a more significant role in maintaining long-term attachment and bonding.

Keats' "Ode to a Nightingale" uses the nightingale's song and the encompassing darkness to create a sense of yearning and escape. These poets understood the subconscious impact of atmosphere on the reader or listener.
